\$50,000

Project Timeframe:

4 months

Technologies Used:

AngularJS, .NET, Web API,
Sharepoint, C#, HTML5,
javascript

Commercial Lease Management System

Challenge

A large commercial real estate firm identified an issue in their business process – their employees were doing far too much paperwork and attempting to manage their leases via Excel sheets and email. At the time, a significant number of full time resources were devoted to these kinds of tasks.

Unstoppable Software was hired to develop software using Angular, a leading-edge javascript web development platform, that would enable them to manage this workflow with far less effort and fewer mistakes. Our software not only needed to be user-friendly and easy to use, but it also had to integrate with existing third-party platforms the company was running such as Sharepoint.

Results

We dove into this project and were able to complete the system within 4 months, ahead of schedule and to the customer's delight. Their end users loved the system and quickly accepted it. They were able to save an estimated \$500,000 a year in unnecessary costs for their \$50,000 software development investment.
